

- ① 2 Coffee Breaks (CT) $\begin{cases} \text{AM} - 10:00 \\ \text{PM} - 2:30 \end{cases} > 15 \text{ mins}$ Yes = +1
No = +2
- ② Lunch Break - 12 PM (1 hr)
or 11:30 am

GitHub Copilot = Generative AI Application.

'FM | LLM' = Pretrained Model on very large scale of Internet Data (Raw Data)

Foundation Model | Large Language Model

[Image, Text, code, json, pdf, videos, Audio]

Model → Data → understand patterns & context

| FM | LLM | → General Domain Knowledge

1 June 2026

↳ GitHub Copilot = Credits

'Inline Suggestions' X Auto completions

PROMPT Engineering.

Copilot is "context" + "Rules" + "Target Output".

- ① Context = Existing code, file structure, interfaces, examples.
- ② Rules = Language, style, libs, performance & security rules.
- ③ Target Output = Produced = [func, Tests, Refactor, explanation, debugging]

"Golden Prompt Template"

- ① Goal: what you want
- ② Inputs/Outputs: function signature, data shape
- ③ Rules: Must / Must not
- ④ Edge cases: nulls, empty array, invalid input
- ⑤ Examples: one / two
- ⑥ Deliverables: code, Tests, explanation.

Best Practices

- ① Give Copilot "the world it lives in"
When it can see: file, interfaces, sample data.
- ② Ask for incremental output, not a WHOLE System.
- ③ Force "decision transparency"
✓ Give 2 options & recommend one with tradeoffs.
✓ Explain why you chose this algo.
